Centralization – AWRF Solids Handling Facility

June 2025

UTILITY PROJECT

The project generally consists of additions and improvements to the Airport Water Reclamation Facility dewatering operations, including the addition of one (1) new building, two (2) centrifuges or dewatering units, and one (1) 1M-1.5M gallon solids holding tank which will ensure the City has the capacity and redundancy for centralizing wastewater processing at the AWRF facility.

The City selected Water Works Engineers for the design and awarded the engineering contract in September 2024.

A 30% design review was completed in May and a 60% design review is scheduled for July. The City anticipates completing design in late 2025, bidding and awarding a construction contract in early 2026, starting construction in mid-2026, and completing construction in late 2027.
