Double D Drive Reconstruct and Drainage Improvements

November 2026

ROADWAY PROJECT

The project consists of reconstructing Double D Drive with new asphalt pavement and substructure. The project includes reducing the roadway width to allow for construction of vertical curbs to improve drainage without negatively impacting existing driveways. The project will include replacing defective sidewalks and upgrading existing drainage features. The Utilities Operations group has conducted a condition assessment of existing water and sewer facilities and determined that the water system requires replacement.

Staff are evaluating Engineering firms to provide engineering services to complete the project design.
